Project Summary

SUB-CHECK is a server-side behavioral anti-cheat platform designed for multiplayer and competitive games. Instead of relying on invasive kernel-level drivers (Ring 0) that cause crashes, trigger privacy concerns, and lock out Linux/Steam Deck players, SUB-CHECK inspects high-frequency kinematic telemetry (view angles, mouse movement physics, and reaction latencies) directly on the game server. It produces a real-time risk score (0.0 to 1.0) enabling risk-driven quarantine matchmaking and targeted review without compromising player device security.

Repository Contents & Deliverables Breakdown

Directory	Deliverables Included	Status
report/	Final Customer Development Report (Assignment_3_Report.pdf & Assignment_3_Report.docx)	Completed
questionnaire/	Audience segmentation, The Mom Test interview script, and 32-respondent dataset (responses.csv)	Completed
evidence/	Qualitative interview transcripts (5 recorded sessions), evidence notes, and screenshots catalog	Completed
analysis/	Quantitative metrics (analysis.xlsx) and 5 statistical charts (Kernel sentiment, DMA awareness, etc.)	Completed
presentation/	Assignment 3 slide deck (Assignment_3_Presentation.pdf)	Completed
sources/	Academic references, industry literature (DMA exploits, Steam survey), and methodology guides	Completed
