Server-side aim analysis for studio moderators

Nurzhan Bekmurat, Azamat Yermukhan, Yernur Khuan
Group CS-2406

Research material

20

survey participants

3

recorded interviews

Answers per question: 20, 19 or 9

We have summary charts, not individual answers

Interview and survey participants may overlap

Course minimum: 30 online participants or 5 face-to-face videos

Customer roles

Buyer

Studio lead

Controls the budget and integration decision

User

Moderator

Reviews suspicious matches and appeals

Player

Competitive player

Needs fair matches and fair decisions

Next interviews: confirmed studio buyers and moderators

Only 2 of 20 selected game developer

Sources: Assignment 2, Q01 and Q03. Future recruitment is our plan.

The cheating problem

17 / 19

rated seriousness at 4–5

89.5%

Average satisfaction with current tools: 2.95 / 5

Results describe this sample

14 / 20

met cheating often or sometimes

70%

Interest and concerns

Number of participants (n=20)

**16 of 20 rated
usefulness at 4–5**

Interest does not prove
detection quality or
payment

Sources: Q13 and Q16, n=20. People could select several concerns.

Review before permanent bans

Number of participants (n=20)

**20 of 20 said
review would
increase trust**

Review time and cost still
need testing

Sources: Q17 and Q18, n=20. Several actions could be selected.

Where the service should run

5 of 9 require strict data privacy controls

Compare local servers and cloud in a pilot

Sources: Q21 and Q23, n=9. These are technical participants, not confirmed buyers.

Interview findings

I01

Mobile game director

Main problem: game money and ammunition

Limited fit for our aiming product

I02

Independent developer

Checked logs after wrong score rejection

Reliable checks and integration control matter

I03

Developer with server experience

Data analysis must not stop gameplay

Measure extra load and handle failures

Changes to the idea

Keep aim analysis beside current anti-cheat

Show event evidence and save review decisions

Collect only needed data and allow server choice

Use a limited free pilot before a paid offer

Updated business model

Customers

Shooter studios

Value

Aim evidence and fair review

Channels

Developer contacts and guides

Relationships

Pilot help and support

Revenue

Test monthly or usage prices

Activities

Integration, analysis and review tools

Resources

Labelled game data and technical skills

Partners

Pilot studios and moderators

Costs

Development, servers and support

A limited free pilot comes before the paid offer

Working hypotheses. No confirmed prices or measured service costs.

Next tests

01

Buyer interviews

At least 8 studio leads
or moderators

02

Pilot agreements

At least 3 studios with
data and an owner

03

Technical test

Measure correct and
wrong alerts

04

Review test

Target 20% less
median review time

No automatic bans during the pilot

Test paid offers after useful results and cost measurement

Proposed targets. We have not achieved these results.

Conclusion

The evidence supports a focused pilot

Accuracy, wrong alerts and data control come first

Studio demand and payment remain untested

More participant evidence is needed for the course minimum

Thank you. Questions and discussion.
